Ex Machina

By Linda Gregerson

When love was a question, the message arrived
in the beak of a wire and plaster bird. The coloratura
was hardly to be believed. For flight,

it took three stagehands: two
on the pulleys and one on the flute. And you
thought fancy rained like grace.

Our fog machine lost in the Parcel Post, we improvised
with smoke. The heroine dies of tuberculosis after all.
Remorse and the raw night air: any plausible tenor

might cough. The passions, I take my clues
from an obvious source, may be less like climatic events
than we conventionalize, though I’ve heard

of tornadoes that break the second-best glassware
and leave everything else untouched.
There’s a finer conviction than seamlessness

elicits: the Greeks knew a god
by the clanking behind his descent.
The heart, poor pump, protests till you’d think

it’s rusted past redemption, but
there’s tuning in these counterweights,
celebration’s assembled voice.

Source: Fire in the Conservatory (Dragon Gate, 1982)
there are rhythms of thought, fragile propositions about the intersections of human understanding and human habitus, robust intersections of the pragmatic and the sublime, that science shares with art, and I love the thought that poetry can learn from and do homage to its near cousins. The great thing about “facts” (and the scientists are much more sophisticated skeptics than the poets are) is that they put up resistance. Resistance is good for art, and for thinking in general.”
